Saving Your ProShow Programs for Showtime or Travelogue

Set your program up with 16:9 ratio for best showing as that is the native resolution of the Camera Club projector. In order to make use of the entire projection screen you may want to crop your images to a 16:9 aspect ratio but that is your choice. You may instead want to crop the images the way that you would normally crop them for the best presentation. There is no good answer for this. In any case you should make the pixel size at least as large as the screen capability (1920x1080). Using pixel sizes larger than this will not result in any more detail but using smaller pixel dimensions will result in lower quality.

For the best possible quality for Travelogue shows shown with a MAC, create an MPEG-4 File (plays with Windows Media Player or other players - ProShow menu items are shown below)

    Publish -> Publish Show

    Select Video Files -> For Web or Device -> Video File ->
        MPEG-4 (h.264 1080p) -> create...pick a location to save to

OR...for ProShow Only

Create a ProShow Executable file which produces a much smaller file and does not require a media player. An mpeg-4 file will result in noticeably higher quality when viewed on your computer monitor but because the technology of a projector is different from a computer monitor there is essentially no quality difference between a ProShow executable file and an mpeg file when shown with the Camera Club projector.

    Publish -> Publish Show

    Select PC Executable -

    MENU - no menu

    SHOWS - your show should be here, uncheck 'include intro show'

    OPTIONS   -
        check 'start playback fullscreen'
        uncheck 'loop show'
        quality - leave defaults as is (85% and medium)
        check 'enable on-screen playback controls'
        For Producer only there are a few more options (branding tab)

    CREATE - give it a file name and select a location to save your show
